PREEMPTIVE IDENTITY EXPOSURE MANAGEMENT

Reduce hybrid identity exposure before the next attack

Discover identity exposure, prioritize what attackers can exploit, and remediate before it becomes an attack.

WHY NOW · THE IDENTITY ATTACK SURFACE

Attackers no longer break in, they log in.

55%

of organizations experienced an identity-related compromise in the past year, despite 85% actively using ITDR tools.

SANS 2026 STATE OF IDENTITY THREAT DETECTION AND RESPONSE

83%

of investigated incidents in cloud environments involved threat actors exploiting identity issues for initial access.

GOOGLE CLOUD THREAT HORIZONS REPORT, H1 2026

3.4 hrs

on average for attackers to reach the Active Directory server after gaining initial access.

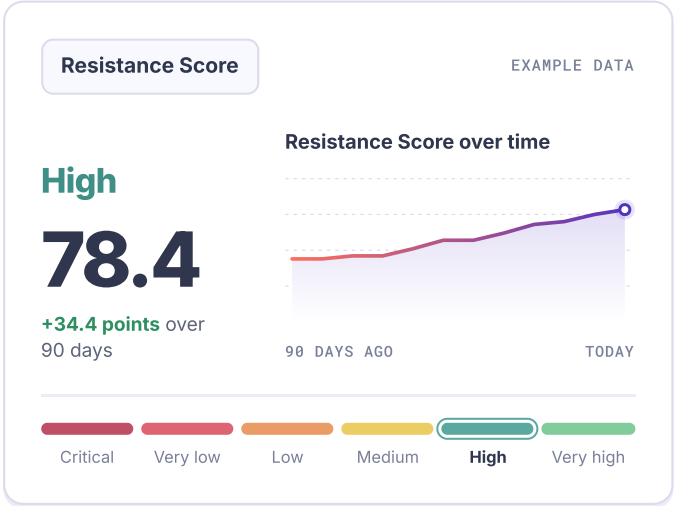

SOPHOS ACTIVE ADVERSARY REPORT 2026

WHAT WE DO

Find attack opportunities. Prioritize fixes. Measure progress.

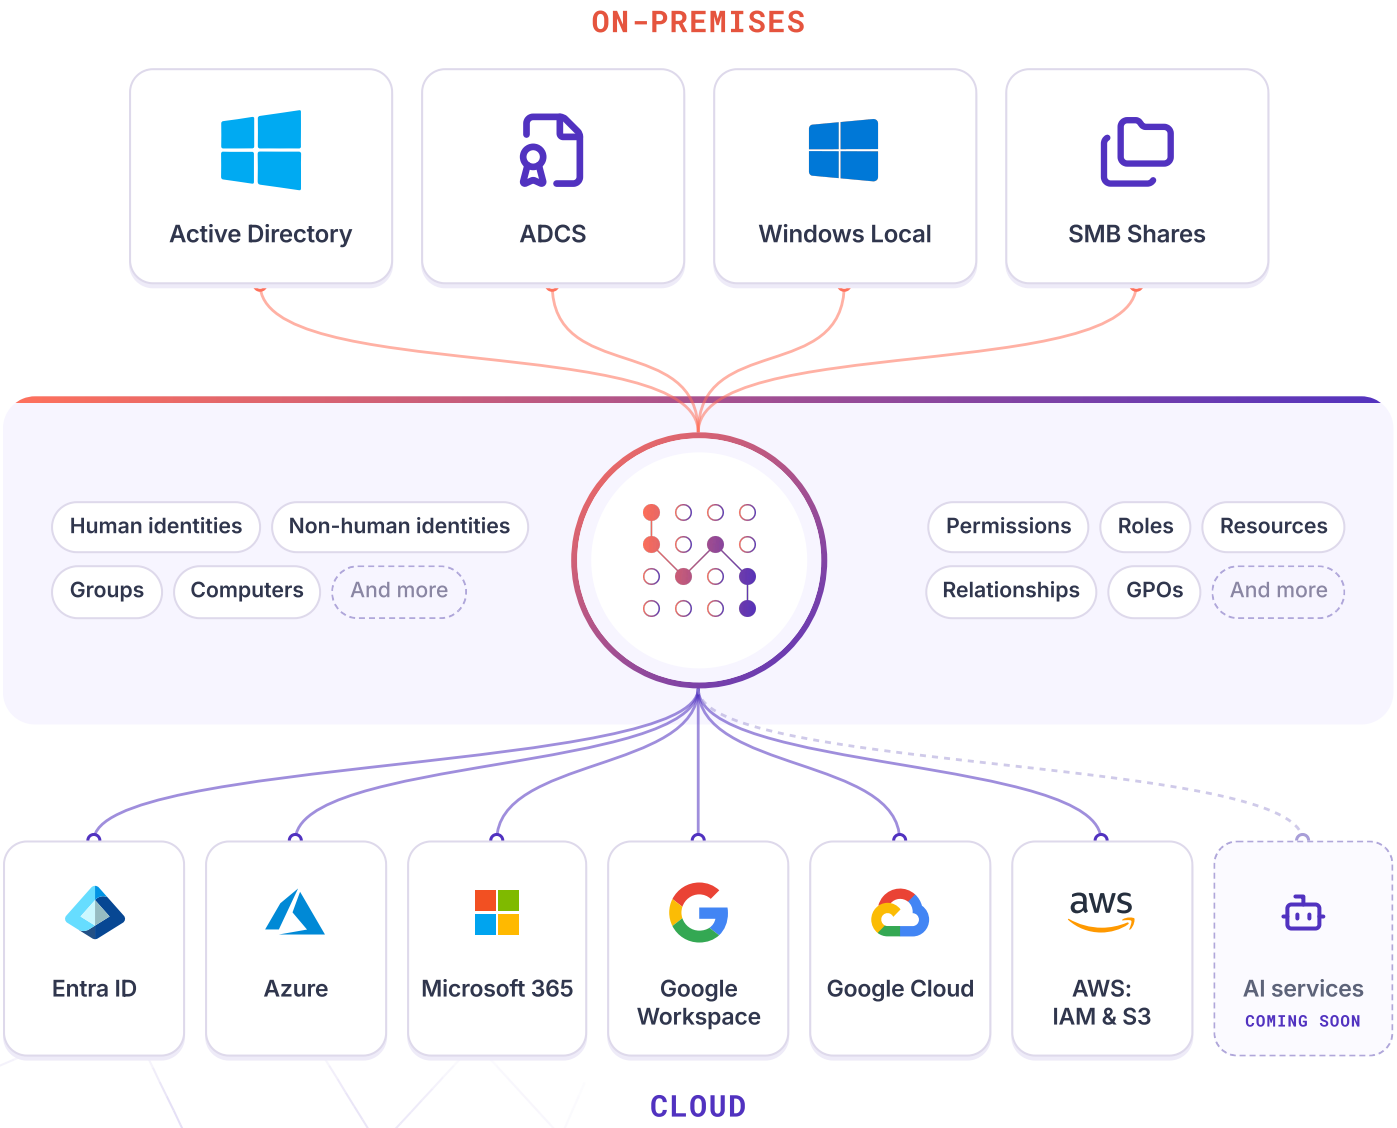

Saporo connects identities, attack and access paths, misconfigurations and flagged events to reveal attack opportunities across on-premises and cloud environments. Its graph analysis shows what attackers could exploit, how far they could move and what to fix first. Guided fixes and automated workflows help teams reduce exposure and measure progress.

Agentless deployment in as little as one hour.

HYBRID IDENTITY COVERAGE

See identities and access in one graph

AI SERVICES AND APPLICATIONS

See your AI. Understand its reach.

01 **Discover AI.** Build a unified view of AI services, applications and agent identities across on-premises and cloud environments.

02 **Understand access.** Connect AI applications to the identities, credentials and permissions they use.

03 **Reduce exposure.** Reveal attack opportunities, prioritize fixes and track exposure reduction.

SOLUTIONS

Reduce identity exposure with Saporo

Six solutions. One platform to understand, reduce and measure identity exposure.

Unified Identity Visibility

Connect human and non-human identities, permissions and relationships across on-premises and cloud. Give teams one graph with scoped views of their identity exposure.

1 graph
One shared view across a hybrid environment

Attack Path Reduction

Find and remediate individual attack and access paths to critical assets. Target shared chokepoints to eliminate millions of attack paths with fewer changes.

80–95%
Attack paths to Tier 0 + other critical assets removed

Tiering & Segmentation

Identify access that crosses tier boundaries and exposes critical assets. Prioritize fixes, verify isolation and identify new violations as your environment changes.

3–6 months
Estimated project time, instead of 12–24 months

Compliance Readiness

Connect identity findings to ANSSI, CIS, ISO 27001 and other frameworks. Prioritize remediation, track control improvements and demonstrate progress with audit-ready reports.

40+
Frameworks mapped to identity security controls

Hardening Automation

Turn prioritized findings into guided fixes and automated workflows. Remediate current and new matching exposures, with approvals where needed and measurable progress.

Hours → minutes
Unlimited workflows, 100+ prebuilt templates

Change & Event Monitoring

Track identity changes and flagged events. Use permissions, misconfigurations and attack paths to understand their impact on critical assets and prioritize investigations.

85+
Built-in log controls that flag activity worth review

CUSTOMER STORIES

From blind spots to measurable results

PROVEN ROI ACROSS 100+ ORGANIZATIONS

200 hrs
saved yearly on Active Directory & Azure hardening

100%
Tier 0 identity segmentation within three months

5–20
chokepoints eliminate millions of attack paths

40+
frameworks mapped, with 800+ security controls

> *Saporo offers a unique view of both misconfigurations from frameworks like ANSSI and attack path evolution, enabling our teams to improve AD security much faster and with less resources.*

CISO, LARGE FRENCH HOSPITAL
